## I Need More Energy!

You're in the middle of a long workout and you're wondering how in the world you're going to muster up enough energy to finish. It's as though someone has unscrewed the cap and let all the fuel out of your tank. So what should you reach for to help you comfortably finish your workout? Sports-product manufacturers have come up with all sorts of new items to help you do just that. But are they really any better than the old standards: water, a banana or a bagel?

### Water

Water is a calorie-free source of the fluid your body needs to keep going. There is no better way to compromise performance than to exercise while you're dehydrated. Research shows that your heart rate increases eight beats per minute for every liter of sweat lost during exercise. This can occur in as little as 30 minutes of exercise depending upon the environment and your intensity. This increased heart rate, combined with inefficient cooling, causes your temperature to elevate. This not only compromises performance, but can lead to heat illness as well. Most experts recommend drinking at least a cup (4 to 10 ounces) of water every 15 minutes during exercise.

### Sports Drinks

Activities lasting longer than one hour can leave your body wanting more than just water. Sports drinks, which typically contain about 50 to 70 calories, plus vitamins and minerals, are an easy answer to replenish both the fluid and carbohydrate drain that comes from prolonged activity.

### Energy Gels and Bars

Energy gels are a relatively new alternative to traditional sports drinks or bars. They feel similar in texture to pudding and are easy to eat and easy for your stomach to digest. They typically contain about 70 to 100 calories and may also include caffeine and other ergogenic aids. The key is to find one that tastes good and doesn't upset your stomach. Energy bars also provide extra vitamins, minerals and fiber, which ups their nutritional value considerably. But eating an energy gel or bar is not enough. You must consume enough fluid to replace what's been lost and to help speed digestion.

How you choose to refuel during a workout depends on your body's reaction to what you put in it. For sessions lasting less than an hour, water is sufficient so long as you consume at least 4 to 10 ounces every 15 minutes. . Water is an obvious first choice, but you may need extra energy in the form of carbohydrates to get through a particularly long or strenuous exercise session. If this is the case, energy bars or gels and sports drinks may be the answer to your depleted energy supply. Remember that there is no single solution that works for everyone.
